

CANONICAL LESSON

Quality Before Yield

Decision-centred foundations for accountable sector intelligence

Production Unit	PU-B07-C08
Notebook	V7_A_N03
Status	Controlled educational draft v0.1
Data boundary	Synthetic instructional data only

Central decision: Gate agricultural analysis on decision-specific quality, coverage, timeliness, coherence, revisions, and subgroup or geographic gaps.

Learning outcomes

Why this matters

Yield estimates may look precise while critical production areas, seasons, or crops remain systematically under-observed.

The analytical workflow is useful only when evidence, uncertainty, authority, and action are connected explicitly. The model supports professional judgement; it does not replace accountable institutional authority.

Worked cross-sector example

Weighted coverage shows that missing reports from two high-production districts can invalidate an otherwise high national completion rate.

Boundary: The example supports learning and review. It does not constitute an official statistic, eligibility determination, enforcement action, clinical judgement, or operational authorization.

Practice and reflection

- 1.
- Add duplicate detection.
- 2.
- Explain edit versus imputation.
- 3.

- Design correction lineage.

Answer key

- 1.
- Use stable record keys plus content hashes and fieldwork metadata.
- 2.
- An edit corrects with evidence; imputation estimates a missing value and must retain flags and uncertainty.
- 3.
- Preserve original, corrected value, rule, reason, editor, approver, timestamp, and version.

Operational readiness checklist

- Purpose and decision owner are named.
- Evidence definitions, provenance, and lawful access are documented.
- Uncertainty and abstention are visible.
- Human review, escalation, monitoring, incident response, and retirement are assigned.
- Equity, accessibility, security, and sector-specific approval are complete.
