

EXECUTIVE BRIEF

Resistance Signals Require Stewardship, Not Panic

What leaders should authorize, require, and refuse

Production Unit	PU-B07-C27
Decision status	Controlled learning asset
Audience	Executives, programme owners, statisticians, technical leads
Data	Synthetic examples only

Executive takeaway: Interpret antimicrobial-resistance signals with laboratory quality, sampling context, clinical relevance, uncertainty, and stewardship authority.

Why it matters

Decontextualized resistance signals can cause panic, inappropriate prescribing changes, or false reassurance.

Illustrative application

A resistance increase is reviewed with specimen mix, testing coverage, facility context, and prescribing practice.

Minimum approval conditions

- Named accountable owner and lawful purpose
- Defined evidence, provenance, reference period, population, and geography
- Decision-relevant validation and visible uncertainty
- Documented abstention, referral, override, and incident processes
- Accessibility, equity, security, retention, and retirement review

Non-negotiable boundary

The analytical system may inform review. It may not independently authorize benefits, sanctions, enforcement, clinical treatment, school exclusion, displacement, or another consequential action.
